

4th Carbon from Space Workshop

Stephen Plummer

25/10/2022

Welcome and Logistics

'a forum to discuss the carbon cycle cutting across the traditional scientific domains of Land, Ocean and Atmosphere AND improve interactions between the in situ, modelling and Earth observation communities with the objective to improve understanding and observation of the carbon cycle.'

The meetings are coordinated by ESA
co-sponsored by NASA, CEOS, Global Carbon Project and the European Commission

A Brief Historyof Meetings

MEETINGS

Monitoring Carbon From Space

PAGE 384-385

Over the past two centuries, there have been great changes in the atmospheric concentrations of greenhouse gases including carbon dioxide, methane, and carbon monoxide (CO₂, CH₄, and CO). The natural cycles of these gases have been strongly affected by human actions such as fossil fuel burning, land use change, and fire management.

While there will always be uncertainty in understanding a system as complex as the world's climate, there is strong evidence that global warming is occurring and is being

in Italy during the three-day Carbon From Space workshop.

The meeting, jointly organized by ESA, the International Geosphere-Biosphere Programme (IGBP), the Integrated Global Carbon Observations Theme (IGCO) of the Integrated Global Observing Strategy (IGOS), and the Global Carbon Project (GCP), brought together the science community, the space agencies (ESA, NASA, and the Japan Aerospace Exploration Agency (JAXA)), and the observation coordinating bodies (e.g., IGCO) to discuss the state of the science, share knowledge of each other's activities, and coordinate measurements and modeling activities.

2005

EOS Meeting Report

...the underlying theme of the meeting was the need for interaction within and among the scientific community, the agencies responsible for coordinating observations and programs, and the space agencies responsible for space-based observations and satellites

2010

Group on Earth Observations (GEO) Carbon Strategy (Ciais et al., 2010, 2014), Committee on Earth Observation Satellites (CEOS) Strategy for Carbon Observations from Space (CEOS, 2014)

A Brief Historyof Meetings

2016

44 recommendations for activities

2022

3rd CfS Recommendations

Recommendations for Action from the 3rd Carbon from Space Meeting (Land) Progress in the last 5 years

The following series of recommendations were made during the 3rd Carbon from Space meeting in 2016. At the Living Planet Symposium we have organised an Agora discussion session to review progress against these recommendations and look ahead to the 4th Carbon from Space meeting.

We would be very grateful for any observations on what has been done over the last 5 years and what is still to be done, what new issues have arisen.

1. Budgets – Regional

Number	Description	Progress made	What needs to be done
1	Improve partitioning between land and ocean at the regional scale		
2	Reduce discrepancies between methods to estimate regional carbon sinks and uncertainties in models at the regional level.		
3	Improve understanding of actual drivers of sinks at both global and regional levels;		
4	Reduce uncertainty in emissions (both fossil and LUC) and generate annual estimates of LUC to account for important processes (e.g., ENSO-related variability);		
5	Improve understanding of and characterise the CO ₂ effect versus the effect of climate (and land-use).		
6	Explicitly include transport of carbon from land to the oceans		
7	Address inconsistency within inversions for both natural CO ₂ and CH ₄ fluxes		
8	Investigate regional differences between satellite and in-situ observation inversions for natural CO ₂ fluxes.		
9	Estimates of the global terrestrial carbon sink need to be explicitly derived rather than being based on the residual derived from the difference of the other components		
10	For long-term (decadal) carbon balance, improve information on disturbance and regrowth, for an assessment of the site history: Biomass and biomass change; High resolution atmospheric CO ₂ concentrations Fluorescence Soil moisture Diurnal cycles		

9 Recommendation groups	Number
Budgets – Regional	10
Fluxes – Regional	3
Fluxes - Land-atmosphere	5
Attribution	4
Extremes	2
Tipping Point/Sensitive Regions	10
Fossil Fuel CO ₂	5
Address key areas	4
Improve coordination	1

10 For long-term (decadal) carbon balance, improve information on disturbance and regrowth, for an assessment of the site history:
 Biomass and biomass change;
 High resolution atmospheric CO₂ concentrations
 Fluorescence
 Soil moisture
 Diurnal cycles

14 Need further development and testing of data assimilation systems with multiple data streams in parallel with forward model developments e.g. TRENDY project and model-independent data-driven machine learning approaches.

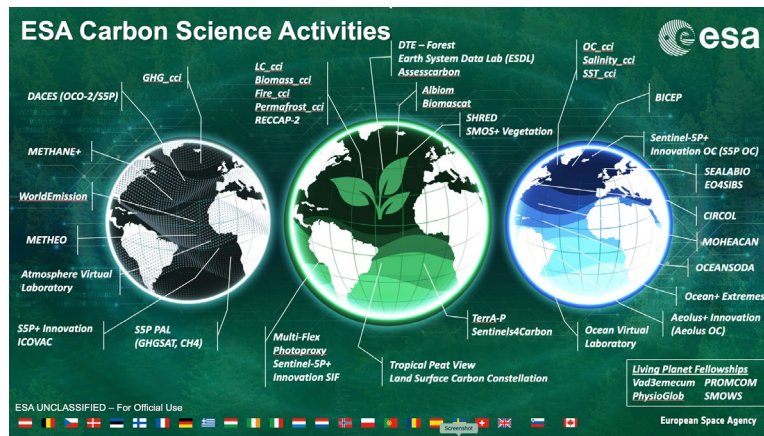

42 Key areas: Carbon dynamics in the boreal permafrost region

3rd CfS Recommendations

Num	Recommendation	Progress made	What needs to be done
44	To coordinate between existing structures e.g. NASA CMS, WMO IG3IS, and research efforts of GCP e.g. RECCAP, UCRM and infrastructural networks such as ICOS, NEON and TERN	<ul style="list-style-type: none"> Improved in situ/satellite contacts Improved coordination across projects e.g. ESA Carbon Science Cluster Improved coordination across agencies e.g. AMPAC, EC-ESA ESSI Improved use of satellite data in e.g. RECCAP-2 Support for RECCAP-2 	

Objective 2022

AN UNPRECEDENTED OPPORTUNITY TO OBSERVE AND UNDERSTAND THE TERRESTRIAL CARBON CYCLE BETTER

To establish a revised strategic plan of research and development activities on terrestrial carbon research for the time frame 2023–2028 in light of:

- Upcoming satellite launches (BIOMASS, NISAR, FLEX)
- Long-term improvements consistency of satellite observations e.g. Copernicus Sentinels
- Better coordinated in situ networks (NEON, ICOS, TERN).
- Improved estimates of the global and regional GHG budgets (CO₂, CH₄, N₂O)
- New technological opportunities and collaborations between partners

To bring together the EO, in situ and Earth system science communities to identify gaps, challenges and issues to address in understanding the **terrestrial carbon cycle**.

ESA Carbon Science Cluster Themes

Interfaces to Ocean and Cryosphere

*Permafrost
Blue Carbon*

Vegetation State and Processes

*Carbon Stocks
(Biomass)*

*Vegetation
Processes*

Land Use and Emissions

*Land Use,
Land Use
Change,
Agriculture*

Dynamics and Disturbance

*Disturbance,
Extremes and
Vegetation
Dynamics*

1st ESA Carbon Science Cluster Meeting

(to be added)

On site speakers:

1. Please upload your presentation via USB stick, on the dedicated laptop of the speaker ready corner.
2. The presentation is **directly launched by the technician**. Slides can be changed with the "**slide advance device**" placed on the podium (**please do not touch the computer!!**)
3. The Podium PC is directly connected to the WebEx link and to the registration audio for remote participant(s) to hear and see the Magellan room.

On line Speakers:

1. Online speakers have full control via WebEx, can **mute/unmute and share** to present the content.
2. The Session chair conducts session flow and he will advise the speaker when 2 minutes are left.

Discussion Sessions

At the end of each session there is an Open Discussion where **all the attendees** can ask questions through the chat or from the meeting room in presence.

The session is also visible on the main screen of the Magellan where the technicians will project the WebEx call.

Session leads will manage the flow. **Please wait for a microphone or an invite for Webex questions**

Introduction and Scene Setting
